

# Ask me anything.

## **1. What are the roles of the advisors/inspirators?**

Each advisor/inspirator has his own personal qualities and network. The advisors are there to support the team if needed. The inspirators will be active to inspire the people through marketing campaigns, or for example to fulfill dreams of the people in need.

## **2. At which liquidity will we launch? What will be the new opening price for XPS?**

Currently, the team is discussing the liquidity situation and opening price. There are multiple scenarios which are being discussed now. We will share more information about these subjects tomorrow, once the final decision has been made. Also the input of multiple community members have been taken very seriously.

## **3. Why is an automated swap possible now, when it was not possible the first time around?**

Due to the previous swapping process, we now have access to all information needed to complete a swapping process.

## **4. Transparency and safety were a big thing for Xpose, will this stay the same with XPS?**

Yes, we aim to have transparency and safety being the big pillars at Xpose Protocol. This is one of the reasons we have decided to host a "Ask Me Anything" twice every month. Safety has to be created through a solid Smart Contract, which has been created now and for the future, also the governance through the community will be assured.

## **5. I have not received my XPS tokens in my wallet, what now?**

When you have successfully participated in the XPS swapping process, you should be able to see your tokens in your wallet. Being provided that, you have filled in your BEP20 withdrawal address (So no Eth address.) before 15.00 CET on the 18th of August, there is one thing you need to do, go to your wallet, and add the XPS contract ID to your wallet. After this, if you still have no XPS in your wallet, you can send an e-mail to [support@xposeprotocol](mailto:support@xposeprotocol).

## **6. For how long did you know about the bug in the contract, before telling the community about it?**

The issue was identified as the volume of transactions started growing. Taking into consideration the complex logic has been added into the smart contract, pinpointing that the exact issue took a significant amount of time. Once the exact issues were identified, we took a couple of hours to structure our message to the community and then issued the statement.

## **7. Can we get a clear view of who is involved in making the Smart contract this time?**

The smart contract will be developed by the same team. We have concluded that this is the best approach as the team is already familiar with the intricacies of the contract functions and was able to correctly identify the issues that came up after the launch. Deploying a new team to write the contract would delay the launch significantly.

# Ask me anything.

## **8. What were the exact bugs in the last contract?**

The logic within the smart contract was clashing with the Pancake Swap algorithm and this needed to be fixed. Additionally, while analyzing the issue after the launch, it was discovered that the trigger amount in the smart contract was set too low. Unfortunately, this was a field that wasn't configurable and needed to be changed. Finally, the smart contract logic for commission storage was flawed and needed to be updated.

## **9. How is it possible there were some wallets who already had tokens in their wallet before the token allocation?**

The tokens were distributed in batches of 300, and the time difference between the first and last batch was approximately 8 minutes. Hence, it might have been possible that a few people received their tokens a couple of minutes before others.

## **10. Which companies are auditing the new smart contract right now?**

Techrate and EtherAuthority are auditing the new smart contract before the launch on the 25th of August.

## **11. Is there proof of a bug? Screenshots etc?**

The bug centers around the fact that the logic within the smart contract was clashing with the Pancake Swap algorithm. Proof for such a case cannot be shared over screenshots or error logs.

## **12. Could you publish a video with a quick and easy explanation about XPS for new investors?**

Yes, this is already being made as we speak. We hope to share this as soon as possible with you guys.

## **13. I am an influencer or top sportsperson. What can I do with Xpose?**

In the future it will be possible to engage with companies/brands to create partnerships through the Xpose Platform. In the Xpose Ecosystem there will be a synergy between creators, brands and community members.

## **14. Where do you see this project in 3 years?**

In three years we see a strong community, which uses the XPS token and Xpose Platform for brand awareness through marketing activities for companies worldwide. Also this is mentioned in the whitepaper: "Xpose Protocol will redefine the relationship between brands, content creators, influencers, and social networks by establishing a blockchain-based platform to connect these disparate stakeholders and offer them the tools to collaborate in the creation, discovery, and distribution of authentic community-driven marketing campaigns"

# Ask me anything.

**15. Can I hire influencers to sell my products on the XPS platform?**

In the future this will be one of the features where Xpose will provide a solution.

**16. Are all advisors/inspirators still on board?**

We can say all the XPS advisors and inspirators are still on board, and excited for the future of XPS.

**17. There were some rumors that around the 18 of august some big announcement would take place (new inspirators maybe). Is this only postponed or is there also a change of plan in this?**

That is right, because of the bug we had to abort the marketing. This will continue after the problem is solved. Nothing has changed except for a delay.

**18. The Xpose team clearly made a wrong start, what are you going to do about it that this will not happen again and how are you going to guarantee this?**

In the current contract where nobody was able to buy because of a bug, we tested everything on the testnet and audited it by 2 external companies. We and the other 2 companies didn't notice the bug. We didn't test it on Pancake Swap because we are only able to do that once the contract is executed. With the new contract we fixed the bug and beside that we tested it on the testnet and audited it by 2 companies we also tested it on Pancake Swap by launching the contract with a test name.

**19. What will be the new name for the token?**

The name of the new token will be shared shortly. It is very important to keep an eye on the official Xpose channels only. This is to prevent you from providing a fake contract ID and token name.

**20. Why did we choose the BSC network?**

Considering the nature of the Xpose platform that would need to support a high volume of user's and interactions, BSCs speed and low transaction fees made it a very attractive choice for both users and developers. Additionally, as BSC is EVM compatible, it allows a seamless shift for user's already familiar with decentralized projects based on the Ethereum blockchain. Furthermore, it also provides an environmentally friendly and more scalable alternative to POW based blockchain platforms.
